Assembly

Before assembling the 3-ring release, make sure the risers are not twisted or reversed. Lay your Wings face down, as you would pack it.

1. Thread each cable into its housing and mate the Velcro of the handle to the Velcro in the pocket. The handle should be positioned as close to the ends of the housings as possible so that a minimum of cutaway cable is exposed.

2. With the rings of the riser facing toward the floor, pass the middle ring on the end of the riser through the large harness ring from above. Fold it back toward the canopy and risers.

3. Thread the smallest ring through the middle ring in the same way, but make sure it does not pass through the large ring, only the middle ring.

4. Pass the white loop over the small ring only and then through the riser grommet so it exits from the rear of the riser.
5. Continue threading the white loop through the grommet on the end of the cable housing. The flat side of the cable housing grommet should be against the riser. Thread the yellow cable through the white loop, making sure the loop is not twisted. Be careful with the cable so as to not bend it too sharply or kink it.
6. Insert the free end of the cable into the channel on the back of the riser. Each riser channel should have a pre-formed opening. If no opening is present on the riser channel, create one using a temporary pin, needle, or other sharp instrument. This opening should be big enough to not add friction to the cable but tight enough to prevent the housing from slipping out of the channel. **MAKE SURE THAT CABLE IS INSERTED INTO THE HARD HOUSING AND NOT TO THE SIDE OF THE HARD HOUSING.**
